Introduction

- A digital twin is a **virtual replica** of a **real entity**
- Born in the aerospace industry, they have been progressively adopted in different fields (e.g., manufacturing and construction)
- More recently the concept of digital twins **has been adopted in the context of Smart Cities**

Introduction

- Exploiting **big data** and **Internet of Things/Internet of Everything** technologies is possible to build a faithful replica of the urban environment
- Digital twin technology can undoubtedly help to **face future urban developments** in several domains
 - Mobility
 - Environment
 - Energy
 - Urban planning
 - ...

Challenges

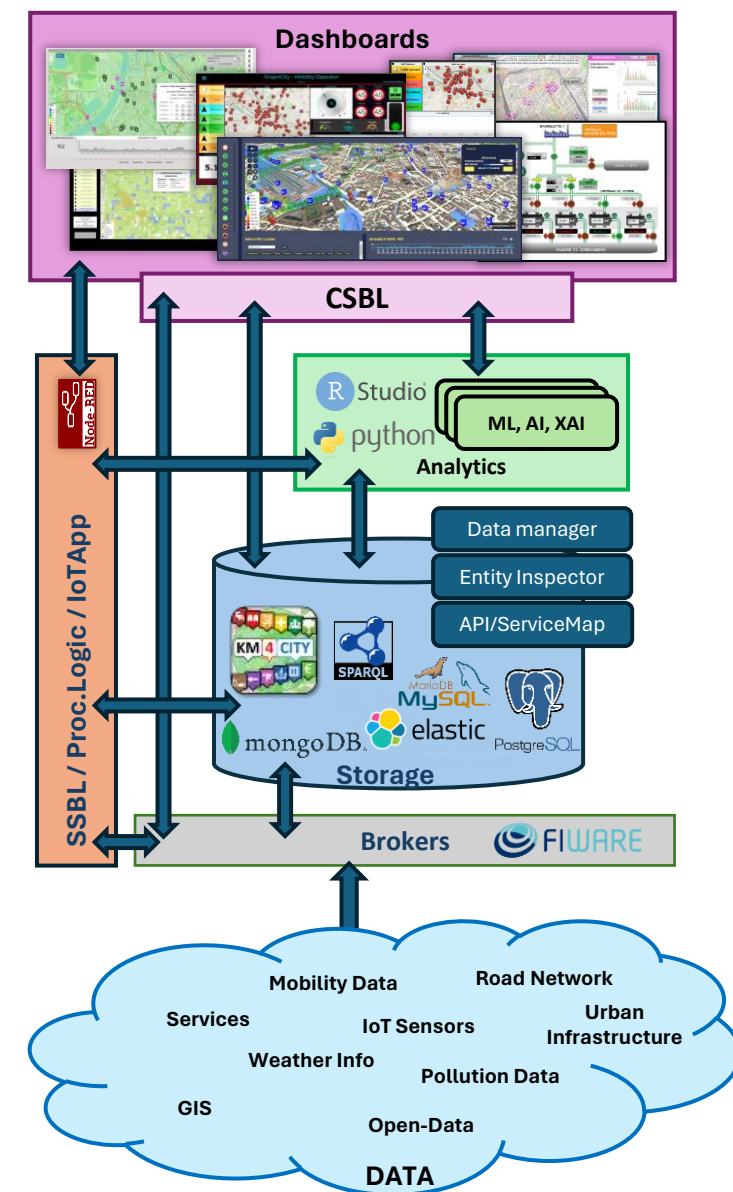

Building an urban digital twin is not an easy task

- **Heterogeneous data** must be acquired to create the so-called **City Information Model**
- **Analytics** for analyses, reconstructions, and simulations must be developed exploiting also **machine learning** and **artificial intelligence** solutions
- **Accessible interactive interfaces** are required to let decision-makers work on the digital twin and **promote citizen** engagement in the urban development

Snap4City platform

- Snap4City is an **open-source IoT platform based on a microservice architecture** developed at DISIT Lab of the University of Florence
- The platform handles **heterogeneous data sources** (IoT devices, Open Data, external services, etc.) exploiting multiple storages with semantic enrichment
- Data are retrieved with **dedicated APIs** and exploited by **data analytic processes** and **IoT applications**
- **2D and 3D dashboards** can be built using a large number of widgets

Interactive 3D Interface

- On top of the Snap4City platform, we build a **web-based interactive 3D interface**

Snap4City Digital Twin Features

- Accurate **3D terrain model**

Snap4City Digital Twin Features

- Multiple **ground maps** and **heatmaps**

Snap4City Digital Twin Features

- PINs to represent **IoT devices, services, bus stops, points of interest, etc.**
- Each PIN can be clicked to access to **additional information and real-time and historic data**

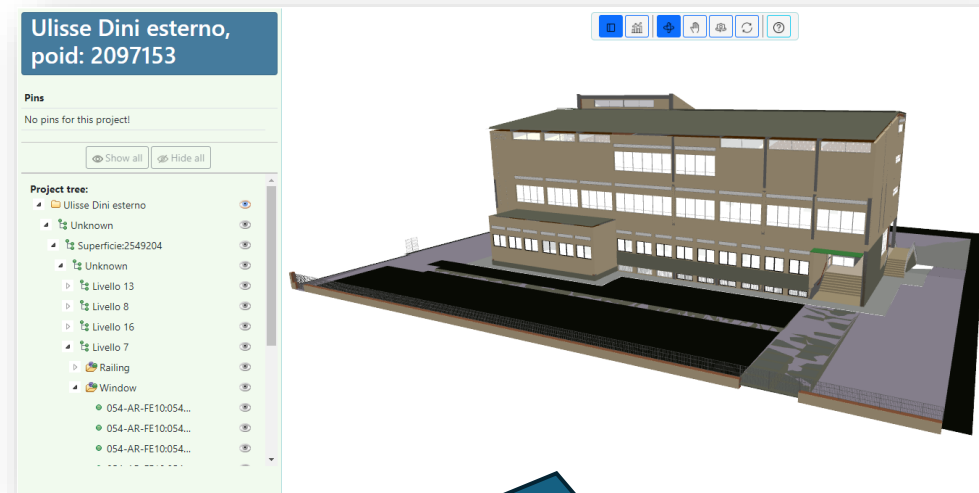

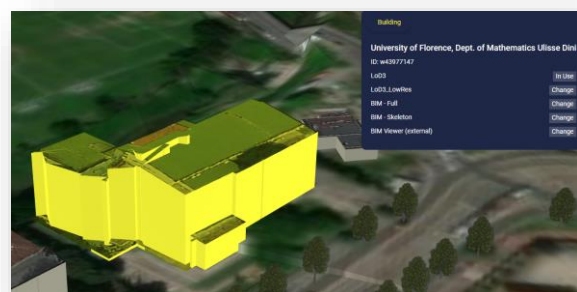

Snap4City Digital Twin Features

- Different kinds of 3D building models
 - Simple box-like 3D representations
 - Accurate 3D reconstructions
 - 3D Tiles (e.g., Google Photorealistic 3D Tiles)

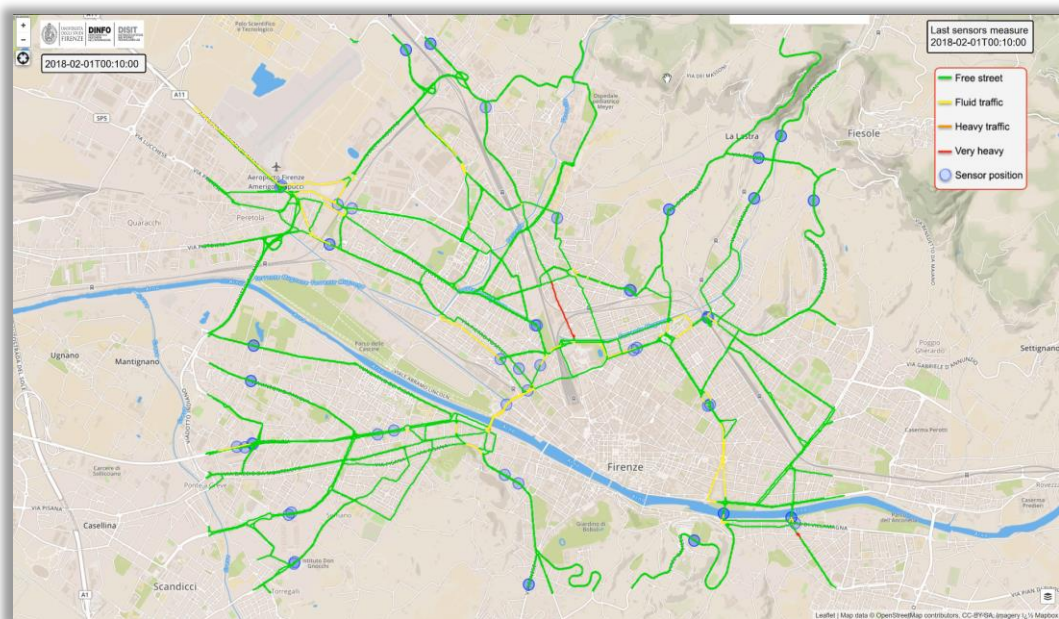

Snap4City Digital Twin Features

- Buildings can be **changed in real-time**, and BIMs can be integrated when available

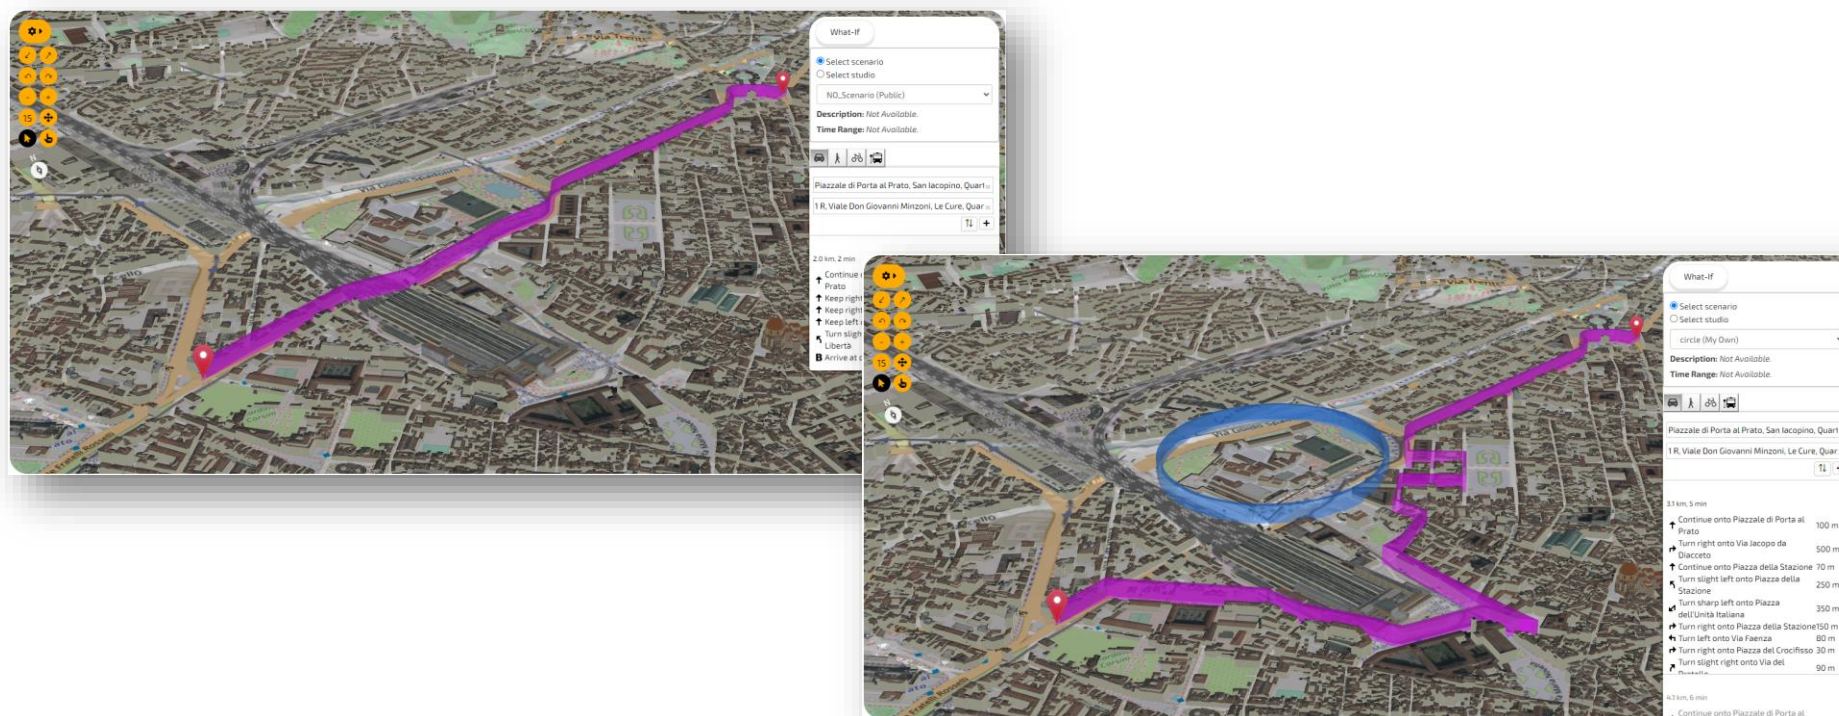

Snap4City Digital Twin Features

- **Traffic flow reconstructions** can be visualized with animated 3D arrows

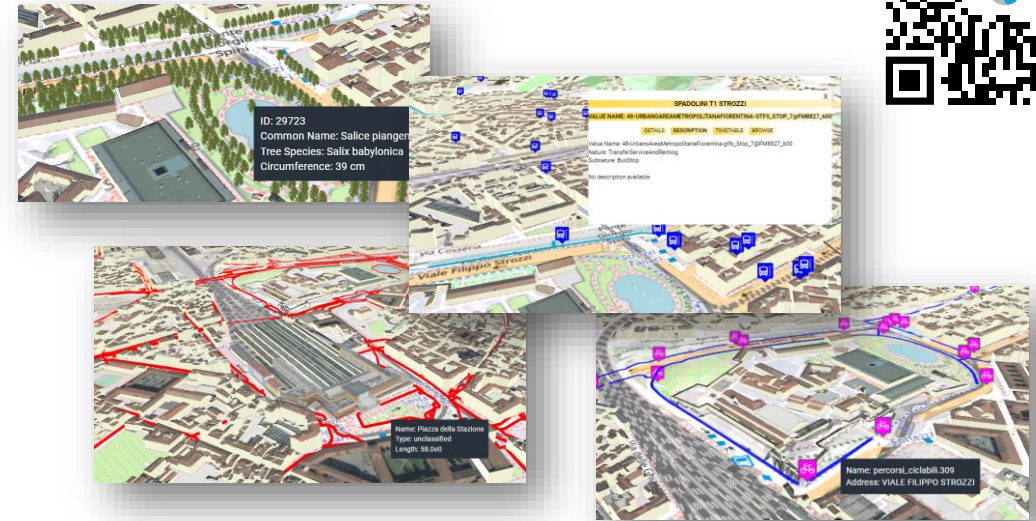

Snap4City Digital Twin Features

- **What-if analysis** can be carried out, for example to observe routing changes due to temporary areas blocked to traffic

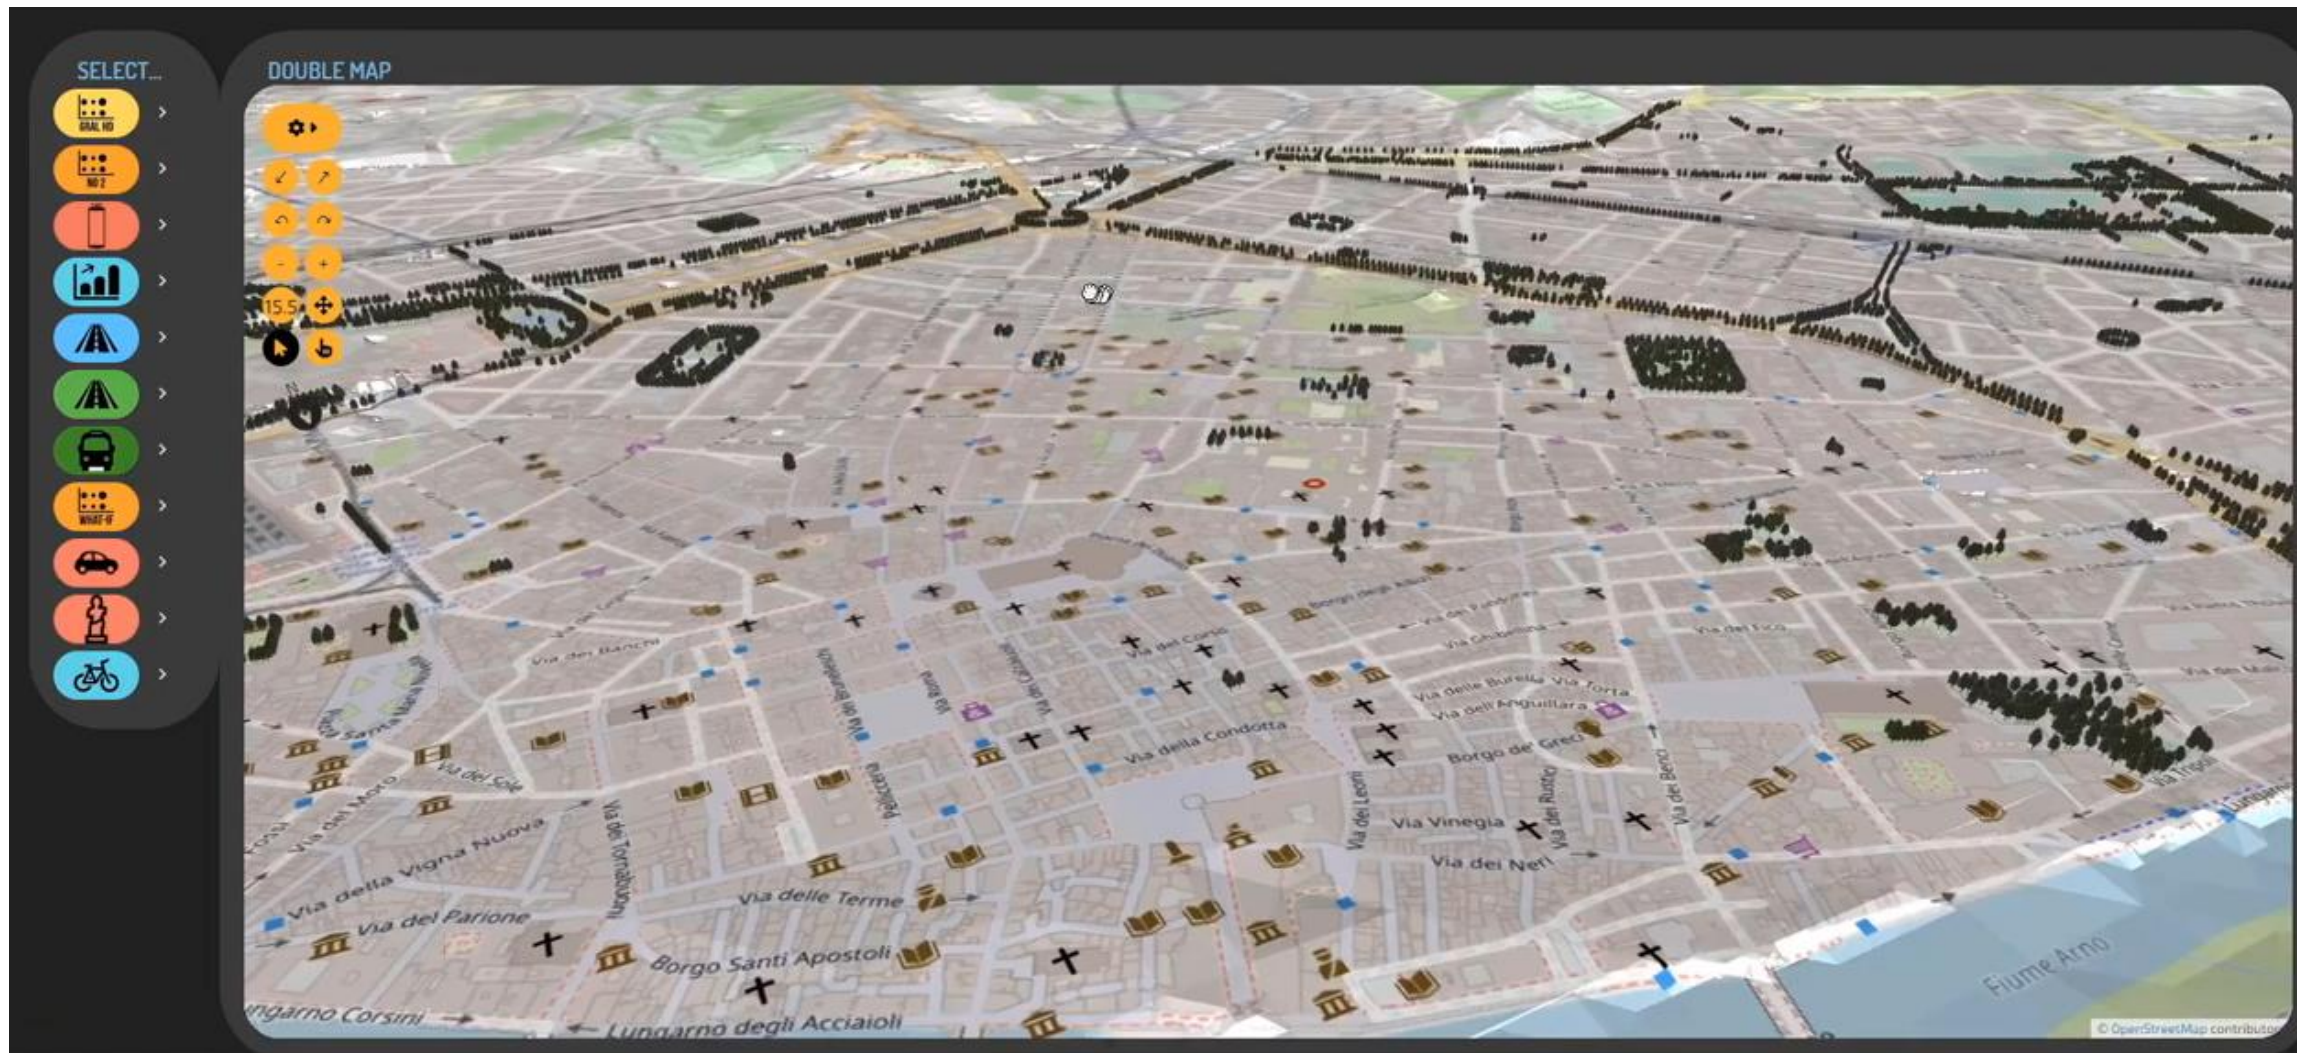

Snap4City Digital Twin Features

- Many other features are available:
 - Road description
 - Public transport routes and scheduling
 - Available cycling paths
 - ...
- For a complete description, see
 - Snap4City Digital Twin (<https://digitaltwin.snap4city.org/>)
 - L. Adreani, P. Bellini, M. Fanfani, P. Nesi and G. Pantaleo, "**Smart City Digital Twin Framework for Real-Time Multi-Data Integration and Wide Public Distribution**," in IEEE Access, 2024, doi: 10.1109/ACCESS.2024.3406795. <https://ieeexplore.ieee.org/document/10540577>

Conclusions

- Smart City Digital Twin are fundamental tool to **inspect the urban environment** and **perform analyses and simulations**
- Such tools can help city officers and decision-makers to address **problems spanning in several fields** (mobility, environmental, urban planning, etc.) as **support decision systems**
- Thanks to accessible web interfaces, **citizen can better comprehend** the urban environment and **actively participate** in the development of their cities
- **Further works are still required** on data accessibility, on analytics for simulations and what-if analysis, and on interfaces
