15MinCityIndex

What would support my neighborhood to become a 15-Minute City?

Using the Open Data:

We developed a data analytic tool based on municipal and national open data to assess services adequacy for people living in each 15 minutes areas of the city.

Good public transport services: bus, new tram line, train stations, cycle paths.

Careggi/Rifredi is a relevant district in Florence because of hosting the main Florence/Tuscany hospitals Careggi and Meyer, but also university headquarters and many other workplaces.

The tool supports the becoming of a 15-Minute city evaluating the service level in various domains.

- Ethical Explainable Artificial Intelligence

The difference is on computational models

- **Simulation models,**
- **statistics and operations research techniques**
- **Machine Learning and Artificial Intelligence techniques**
 - exploitation of heterogeneous data, **BIG DATA**
 - Predictions, Early Warning, Anomaly Detection, ...
 - **What-If Analysis** integrating predictive models and simulations
 - **Explainable AI, XAI, providing to the decision-maker**
 - **detailed explanations** on the motivations behind the suggestions provided, so that the decision maker can understand the process and the motivations
 - **evidence of compliance with ethical aspects with confidence**
 - *To be able to use the systems as a trusted expert system.*

XAI: Explainable artificial intelligence

```
with tf.device('/device:GPU:0'):
    explainer = shap.TreeExplainer(MODEL)
    shap_values = explainer.shap_values(X_train)
```

SHAP Global interpretability

```
shap.summary_plot(shap_values,
features_names, plot_type="bar")
```

```
shap.summary_plot(shap_val
ues, X_train, features_names)
```

- **Feature importance:** Variables are ranked in descending order.
- **Impact:** The horizontal location shows whether the effect of that value is associated with a higher or lower prediction.
- **Original value:** Color shows whether that variable is high (in red) or low (in blue) for that observation.
- **Correlation:** A high level of “Day3” or “PrecipiSIR” content has a high and positive impact on the classification. The “high” comes from the red color, and the “positive” impact is shown on the X-axis.

SHAP: Local interpretability

```
with tf.device('/device:GPU:0'):
    explainer = shap.TreeExplainer(MODEL)
    shap_values = explainer.shap_values(X_train)
```

```
shap.force_plot(explainer.expected_value,
                shap_values[7,:],fields)
```

- The ability to explain each prediction, is a very important promise in an explainable AI.
- (a) value of VelMaxSIR, MaxTempSIR, Day3 and Humidity contributed significantly to the classification of the observation as a landslide event.
 - (b) values related to rainfall in the last days, LevelSIRldr and Humidity given a relevant contribution to the landslide event prediction.
 - (c) the value of features: Day3, MaxTempSIR, MaxTemperature, Temperature and LevelSIRldr have been determinant for the classification of the observation into a no landslide event.

into CO2 sensor area

Traffic Flow data

- Traffic Flow is one the main source of CO2 (**ton of CO2 x Km x Vehicle**)
 - **K1: Fluid Flow**
 - **K2: Stop and Go**
- **Dense estimation of CO2 into the city** is very useful to know to target EC's KPIs

Computing CO2 on the basis of
traffic flow data
